Dear Patricia,

Biodiesel B20 Use in School buses: Denver just recently approved using B20 in over 400 school buses after a lengthy trial in 40 of them. It is especially important in Denver because of the geographically caused air pollution problem they have. This is a low cost relatively immediate solution that could help our children who spend so much time on these buses. Because of the federal tax credit for biodiesel blends, the cost is relatively the same as petroleum diesel. I recommend the DEP take an active position in recommending this option for the school bus portion of the report. If you need third party evidence as to the benefits of its use from a multitude of school districts around the country adopting biodiesel, please let me know and I will get it to you.

Regards,
